DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 22-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Li (U.S. Patent 5,633,174) in view of Hara et al. (Precipitation Control by Hydrogen and Preannealing at 425 °C in Czochralski silicon Crystals; Int. Confer. Of Solid State Devices and Materials, p. 35-37; cited by applicant).

Li teaches a method of forming a layer of microcavities by introducing a gaseous species into the substrate of the second material such as hydrogen, forming precipitate embryos from the nucleation centers, and growth of the precipitates, wherein the precipitates are formed from species in the second material, and wherein growth is carried out by thermal diffusion, the substrate is silicon, but fail to teach that precipitate embryos are grown through species concentration of, for instance, oxygen, thus producing an embedded layer of silicon dioxide. Hara et al. teach a method of using hydrogen to increase the diffusion coefficient of oxygen to cause embryo formation and precipitation. One skilled in the art at the time of the invention would have been motivated to concentrate oxygen as taught by Hara et al. as part of the method of Li in order to form an oxide layer and thus obtain a thin surface layer with an embedded layer with good insulating properties, for example, oxygen.
